Topic Job Skills Preparation	Author Kenniel Torres Laboy	Date 29/08/2022

Problem Background

Despite today's access to an abundance of resources, inaccurate or outdated information is presented when searching for jobs. In addition, technology keeps evolving, and keeping track of what skills companies look for remains a difficult task.

Countermeasures

Develop a web app that collects and displays sought after job skills, which are obtained from current job postings and technology trends.

Target

Provide an authentic list of job skills currently sought after by companies.

Causes

- As professionals search the web for error-free information about job positions, many articles provide them with a list of skills that are dated or currently unused.
- There is not a standardized data base that is consistently updated to stay with current, and future, skills for jobs.

Check/Evaluate

Ask users for feedback to verify that the service provided was accurate and helpful towards receiving a job offer and/or acquiring a job position.

Act/Standardize

A yearly list of common and sought job skills is to be approved by the U.S. Department of the Interior.
